

Executive Summary Report for scottyab/rootbeer

Scatter Plot Weeks Vs File

Insights on Project

Based on this plot for the repositories source files while also looking at the commit history Scott has been doing the most work recently and overall throughout the project's history. Most recently the updates have been to the readme for documentation and updating the code to use Kotlin and CMake. Developers that could have left the project are Mathew Rollings, Mat, Ivan, Daniel Kutik, Frieder, and Vayas since they have not had a commit in over 50 weeks. Something to note is there have not been any commits since 2021 but there are still recent pull requests like one to add support for larger page sizes and updating SDKs.

Git commands I found particularly useful in doing this lab

git checkout -b: was useful to create a new branch and go to it after it has been created
git push --set-upstream origin <branch>: was useful to push the new local branch I created to GitHub
